

Front-cover

A single page with the next information:

- Title
- The group id (PGN)
- The name of each member
- The number of hours each member has participated in the Project. The grade Will be proportional to the implication of each member.

Abstract

A brief summary of the work done in the assignment. It must include: a description of the problem, the methodology followed, key findings, and implications of the work.

Limit this to 200-300 words.

Problem

- **Background:** Provide context about the optimization problem being addressed. Mention why it's significant and relevant.
- **Problem Definition:** Describe the optimization problem in detail, including the constraints, objectives, and mathematical formulations if applicable.

Algorithm design

- **Metaheuristics Used:** Detail the selected bioinspired metaheuristics for solving the problem. Explain the rationale behind their selection.
- **Codification Used:** Described the codification used for each metaheuristic in case that they are different.
- **Implementation Details:** Describe the computational tools, programming languages, or software used. Include pseudo-code or algorithms.

Experiments Design

- **Parameter Settings:** Discuss the configuration of parameters for each metaheuristic that will be tuned, and why/how they have been selected.
- **Experimental Setup:** Describe how the experiments will be conducted. Specify how the different methods will be compared (what metrics will be used, what statistical tests, etc). Discuss the main limitations of the setup.
- **Data description:** Describe the data instances collected to do the experimentation. Describe the sizes, the complexity of each data instance, for what part of the experimentation will be used (parameter tuning, comparison, etc).

Experimental results

- **Results:** Present the findings from applying the metaheuristics to the optimization problem. Use tables, charts, or graphs for clarity. Analyse the results, highlighting the strengths and weaknesses of each metaheuristic in the context of the problem solved. Discuss any challenges encountered during the experimentation and how they were addressed.
- **Code:** Include a link to the repository with all the code needed to replicate the results shown in this section.

Conclusion and Future Work

- Summarize the key findings and their implications.
- Suggest areas for future research or further improvements to the metaheuristics or the problem-solving approach.
